General Information

The range of receivers covered by this Service Information incorporate main chassis type A823AV and varicap tuner units in place of the mechanical tuners fitted to the earlier range of single standard colour receivers. These receivers are basically similar to the earlier range but use the Z582 I.F. and Sound Output panel instead of the A809 or Z182 panels; and the Z584 Decoder instead of the A807 or Z180 panels. Information noting the differences between the Z582 and the Z182, and between the Z584 and the Z180 are given below.

The principal information contained in this publication concerns the varicap tuner and a.f.c. panel type Z513 (incorporating a.f.c. panel type Z512 and u.h.f. tuner type Z511). This standard unit covers the u.h.f. bands 4 and 5, but if required, these receivers may be converted for operation on v.h.f. bands 1 and 3 by fitting conversion kit type Z564 (which includes unit type Z570, which in turn incorporates a.f.c. panel Z512 and v.h.f. tuner type Z565). The v.h.f. unit type Z565 is manufactured by Mullard Ltd: no detailed information on this unit is included in this publication.

I.F. and Sound Output Panel, Type Z582.

This panel is identical to panel, type Z182 apart from the inclusion of a pre-set Colour control mounted on the panel adjacent to the plug 2Z3. This pre-set control replaces the function served by the Customer Colour control on the Z182 panel. Also as part of this change resistor 2R35, 18k Ω , is moved to holes adjacent to, and in series with the pre-set control.

Decoder and R.G.B. Drive Panel, Type Z584.

This panel is a development of the decoder type Z180. The Z584 incorporates provision for con-

trolling picture saturation at high level instead of the low level control of the chrominance amplifier employed on the Z182 i.f. panel. This development involves the replacement of the LK1 on the Z180 panel with a 0.1 μ F capacitor, 3C65 Part Number 2601 0070 and the connection of the Customer Colour control, to two of the test point pins, 3TP27 and 3TP25, these pins becoming plugs 3Z11 and 3Z6 respectively. The Customer Colour control now operates at high level and controls the gain of the chrominance channel within the SL917A s.i.c. This change has necessitated amendments to be made to the decoder Adjustment Procedure, see Page 3.

DECODER & R.G.B. DRIVE PANEL Type A807

RANK BUSH MURPHY

CIRCUIT DESCRIPTION

U.H.F. Tuner Type Z511

The Z511 is a four section transistorised u.h.f. tuner employing three r.f. transistors in a grounded base mode. Transistors 1VT1 and 1VT2 are used as an r.f. amplifier stage; this stage is followed by 1VT3 operating as a combined mixer and oscillator. An a.g.c. control voltage derived from the Z582 i.f. panel is applied to the base of 1VT1. Four quarter wave coaxial lines 1X2, 4, 8 and 10 are employed as tuned elements for the aerial, r.f., mixer and oscillator respectively. Each of these lines is tuned by a varicap diode (1D1, 2, 3 and 4) with trimming and bandshaping of the r.f. and oscillator stages being carried out by coupling loops. The intermediate frequency signal developed across the output coil 1L10 is passed to the i.f. amplifier on the Z582 via 2Z1. By adjusting the customer push-button channel selector, the voltage applied to the varicap diodes is varied and hence the channel to which the unit is tuned.

A.F.C. and Power Supply Panel Z512

An i.f. signal from the Z582 is fed via 2Z5 to the base of transistor 1VT4 which acts, with 1L11 and 12, as a narrow band amplifier for 39.5 MHz. The output from this amplifier is fed to the base of 1VT5, the driver for the Foster-Seeley discrimina-

tor 1D5 and 6 etc. The output of the discriminator is zero at 39.5 MHz, but with decreasing frequency pin 6 of the Module *AE* goes positive and pin 7 goes negative. With increasing frequency these polarities are reversed. This resultant automatic frequency control correcting voltage is either added or subtracted, depending on its polarity, to the positive varicap control voltage set by the customer push-buttons, and appears at the wiper of 1RV2 to be fed to pin 4 of the Z511 where it is used to control the channel frequency of the tuner. The diodes 1D7 and 8 have been included to limit the a.f.c. correcting voltage to avoid an excessive pull-in range. The Hold-in Range control 1RV2 is adjusted to give a holding range of ± 1 MHz at 39.5 MHz. A switch is provided on the customer push-button unit to mute the a.f.c. system whilst tuning.

The integrated circuit 1SIC1, TAA550 stabilises the voltage derived from the +200 V line of the Z584 decoder before feeding it to the varicap push-button control unit. Transistor 1VT6 provides a stabilised supply voltage and bias for the tuner. The base voltage of 1VT6 is held steady by the action of 1SIC1 whilst 1D9 provides compensation for changes of base current due to temperature variation.

ALIGNMENT PROCEDURE

1 Equipment Required

- | | |
|--|--|
| 1. 1 External Bias Unit for Z582 | (See Fig. 19, Page C-16 of TP1741). |
| 1. 2 Oscilloscope | Telequipment S43 or equivalent. |
| 1. 3 Multi-range Meter | 20,000 Ω per volt. |
| 1. 4 Sweep Generator | providing swept i.f. signal 30 to 50MHz. |
| 1. 5 Signal Generator, A.M./F.M. | covering 30 to 50MHz, modulated 50% at 1000Hz, terminated. |
| 1. 6 Signal Generator, U.H.F. | covering 470 to 860MHz amplitude modulated. |

2 Alignment of 1L10 in Z511

- | | |
|---|---|
| 2. 1 Inject a swept i.f. signal into i.f. injection point at 1C29 on the side of the tuner Z511, monitor the output at 2TP8 on the Z582 I.F. Panel. | |
| 2. 2 Adjust 1L10 to position the vision carrier at 50% on the h.f. side of i.f. response (see Fig. 20, Page C-17 of TP1741). | and re-check the display, then reduce the signal input level to check for any signs of instability. Disconnect signal generator and oscilloscope. |

3 A.F.C. Bandpass Alignment

3. 1 Inject a 39.5MHz f.m. signal, modulated ± 100 kHz at 1000Hz, using an input level of 2mV, into 2Z5, 1 and 2
3. 2 Set the A.F.C. Switch, 1SW1 to the ON position and set the A.F.C. Hold-in Range control 1RV2 to its mid-position. Monitor the display at pin 6 of the F. M. Detector module (*AE*) on the oscilloscope.
3. 3 Set the core of 1L11 so that it is flush with the top of its former. Align 1L15, 14, 12, and 11 in that order, for maximum amplitude of display. The display will be a symmetrical sinewave with an amplitude of approx. 0.2V pk-pk.
3. 4 Change the signal generator from frequency to amplitude modulation and set the modulation depth to 50%. Adjust 1L15 only for minimum display amplitude. Revert to frequency modulation

4 A.F.C. Hold-in Range Check

4. 1 Connect the external bias unit (See Item 1.1) to the i.f. unit at 2TP3, 4 and 5. Switch the A.F.C. Switch to the OFF position and set the R.F. Gain control 1RV3 fully anti-clockwise.
4. 2 Inject into the u.h.f. aerial socket, a signal of 600MHz, amplitude modulated 50% at 1000Hz at a level of not less than 1mV. Tune one of the unit push-buttons to this signal, monitoring the output at 2TP8 on the oscilloscope. Adjust the external bias unit to produce a display amplitude of 2V pk-pk.
4. 3 Check that the i.f. produced is 39.5MHz by injecting a 39.5MHz into 2TP1 on the Z582 via a 1pF capacitor and observing any beat pattern on the display.
4. 4 Change the input signal frequency to 599MHz. Set 1RV2 fully anti-clockwise and 1SW1 to ON. Rotate 1RV2 slowly clockwise to a point where the display regains its undistorted amplitude of 2V pk-pk.

These voltages were obtained using a typical receiver under average signal conditions on a mains input of 240V a.c. A 20,000 ohms/volt meter was used with a suitable adaptor for measuring the E.H.T. and Focusing potential. All voltages are positive with respect to chassis unless otherwise stated. N.T. indicates no test.

TABLE & REF SUBCARRIER SWITCH

TUNER, I.F., SOUND AND COLOUR CIRCUITS DIAGRAM

5 Stabilising Voltage Check

5. 1 Check that 1S1C1 (TAA550) is stabilising the voltage at 1Z3 pin 8 at 33V, ± 1 V. Check that the supply to pin 3 of the Z511 is 12V, ± 1 V.

6 Tuning Range

6. 1 With the u.h.f. signal generator connected to the tuner aerial socket, and the A.F.C. Switch 1SW1 in the OFF position, check that the frequency coverage of the tuner is at least 470-75MHz to 853-75MHz. The signal should be

amplitude modulated 50% at 1000Hz and the output monitored on the Z582 at 2TP8, with the oscilloscope. After completing this check disconnect the signal generator and oscilloscope.

7 R.F. Gain Control, 1RV3, Setting

7. 1 With no signal input applied, monitor the voltage at Pin 1 of the tuner unit Z511 with the meter, Item 1. 3, set to its 10V range. Adjust 1RV3 to produce 2-8V at this point.

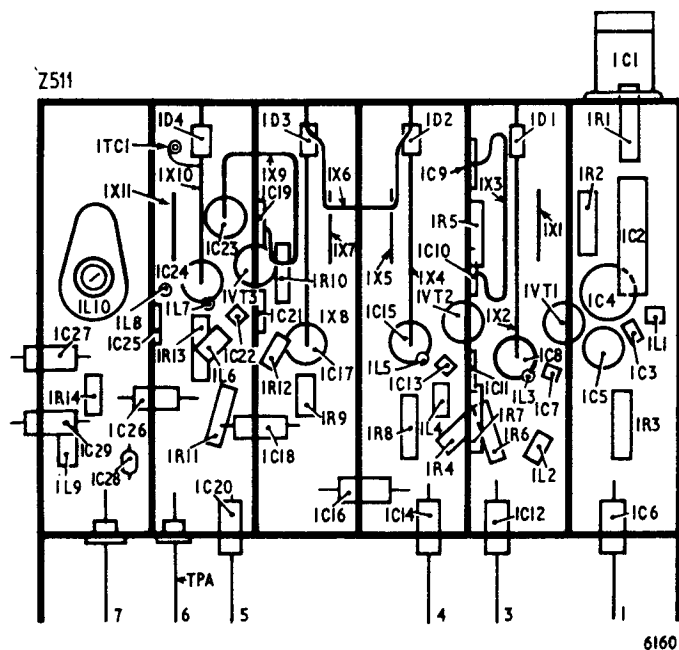

Fig. 1 Component Layout, Tuner type Z511

Fig. 2 Customer Control Unit Interconnection Diagram

ADJUSTMENT PROCEDURE

The adjustment procedure for the Z584 decoder is identical to that for the Z180 decoder, as printed TP1741 Service Information, apart from Sections 23 to 26, Identity Control (Final Adjustment). These adjustments should be now made as follows:

1 Reference Levels

1. 1 Inject a colour bar signal at the aerial socket and monitor the output on the oscilloscope at 3TP7. Adjust the Pre-set Colour control 2RV6 on the Z582 panel to provide 600mV, pk-pk of U reference output at 3TP7.
1. 2 Transfer the oscilloscope to 3TP1 and adjust the Burst Gain control 3RV2 for 450mV pk-pk of the red colour bar at 3TP1.
1. 3 Recheck operations 1. 1 and 1. 2 above to achieve the figures quoted.

2 Identity Adjustment

2. 1 Connect a 10k Ω resistor (preferably $\pm 1\%$ tolerance) between 3TP8 and the wiper of the Identity control 3RV4. Turn the Identity control 3RV4 fully clockwise.

2. 2 De-couple the bi-stable trigger pulse momentarily by connecting a 10 μ F capacitor between the link to pin 5 of the SL917A and chassis (3TP4) and then removing it, until the circuit goes into the 'reverse ident' condition (low saturation, reverse phase colours).
2. 3 Rotate the Identity control slowly anti-clockwise until correct ident *just* occurs.
2. 4 Interrupt the bi-stable trigger pulse 15 to 20 times (See 2. 2 above) to ensure that reverse ident does not occur after interruption of pulse. If it does, rotate 3RV4 a few degrees further anti-clockwise, and repeat.

3 Colour Killer Check

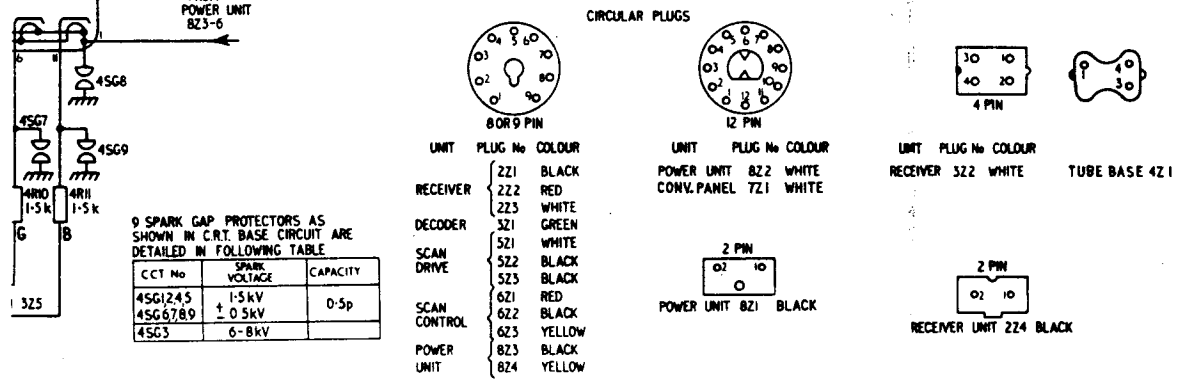

3. 1 Remove the 10k Ω resistor and insert a 27k Ω $\pm 1\%$ resistor between 3TP8 and chassis (3TP4).
3. 2 Change channels by depressing a tuner push-button and ensure that the display does not 'colour kill', if it does repeat section 2 above.

SERVICE INFORMATION

MODELS CTV182S, CTV184S, CT187CS, CV1916S, CV2211S, CT2516CS

Single Standard Colour Television Receivers

This range of television receivers is fully transistorised and the transistors which are employed are robust and reliable under normal operating conditions. However, it is necessary to stress the need to apply the precautions usual when servicing a transistorised receiver i.e. avoiding short-circuits by crocodile clips, leakage currents and/or overheating from a soldering iron particularly in the time-base section of the instrument.

INSTALLATION

NOTE:—The adjustment of the picture controls, i.e. Height, Hold, etc. follows standard practice.

1. **Mains Adjustment.** The receiver as supplied is suitable for a 240 volts a.c. supply. If the receiver is modified for operation on voltages other than 240 volts a.c. this must be noted on the rear of the cabinet back.

2. **Degaussing.** Automatic degaussing is fitted which will normally take care of any magnetic effects induced into the screen. Use an external degaussing coil if required.

3. **Push Button Selection.** To tune, press in the appropriate button and allow it to return to its normal operating position. Withdraw the button slightly and turn it until the receiver is correctly tuned to the desired channel.

NOTE:—Clockwise rotation of a button selects channels in a descending order of frequency.

4. **Tuner AGC Delay Control.** This control should not be adjusted but if its setting has been inadvertently disturbed, however, the slider of the control should be rotated fully clockwise and left in this position.

5. **Purity.** If necessary, adjust the Purity Ring magnets for satisfactorily pure fields on each gun.

6. **Convergence.** Refer to diagram on convergence panel.

MAINTENANCE ADJUSTMENTS

This information is included to enable the correct adjustment of the undermentioned controls to be made in the event of any of these controls being accidentally disturbed.

1. Pre-set I.F. Gain

1. Set the Brightness and Contrast Controls to a midway position.

2. Adjust the Pre-set I.F. Gain control 2RV2 (see I.F. Unit diagram) for a correctly contrasted picture.

3. To check, turn the Contrast control fully clockwise and then operate the channel push buttons. If the contrast level is incorrect resulting in over-loading reduce slightly the setting of the pre-set I.F. Gain control. Re-adjust Brightness and Contrast controls to normal operating positions.

2. Grey Scale

1. Switch on, with no signal input.

2. Remove tuner socket 2Z1 from the i.f. unit to obtain a noise-free raster.

3. Set the R. G. & B. drive controls 3RV8, 3RV9, 3RV10 (see Decoder panel diagram) to maximum, the A1 controls 7RV11 7RV12, 7RV13 (see Convergence Panel diagram) to minimum and the Brightness control to maximum.

4. Adjust the A1 controls in this order (leave all gun switches ON).

(a) the Green A1 control 7RV12, to a just visible green raster.

(b) the Red A1 control 7RV13 until red is just introduced into the raster.

(c) the Blue A1 control 7RV11 until blue is just introduced into the raster.

5. Restore the tuner socket and the signal, adjust the Contrast control to a normal picture and set the Brightness control for the correct black level.

6. Adjust the appropriate A1 control to remove colouration if any, in the lowlights close to black level.

7. Adjust, if necessary, the appropriate drive control for no colouration in the peak white areas (Illuminant D).

8. Check that the overall grey scale is satisfactory.

3. Focus

The Focus control 6VDR1 is adjusted, using an insulated screwdriver, through a hole in the e.h.t. compartment cover. (see Controls Diagram).

4. Set E.H.T.

This control is set for an e.h.t. of 25kV measured under signal conditions with zero brightness on the c.r.t. screen using a high voltage meter whose impedance is not less than 30M ohms.

5. E.H.T. over-volts protection control

This control should not be disturbed from its setting, as indicated by the paint spot, without reference to the recommended procedure.

DIODES

Ref.	Type	Function	Part Number
1D5	AA119	F.M. detector diodes	3641 0020
1D6	AA119		3641 0020
1D7	1N4148	Clipping diodes.	3641 1601
1D8	1N4148		3641 1601
1D9	AA143	Temperature compensation diode	3641 1607

INTEGRATED CIRCUIT

Ref.	Type	Function
1S1C1	TAA550	Varicap supply stabilizer

INDUCTORS

Ref.	Function
1L11	Bandpass coil (collector)
1L12	Bandpass coil (output)
1L13	R.F. choke
1L14	F.M. detector coil primary
1L15	F.M. detector coil secondary
1L16	Rejector coil

TRANSISTORS

Ref.	Type	Function
1VT4	BF194	Narrow band i.f. amplifier
1VT5	BF197	F.M. detector driver
1VT6	BC108	Voltage regulator

Mechanical Parts

Item

Item	Part
Aerial socket moulding and lead	75
A.F.C. and Power Supply panel Z512 complete but less tuner	73
Contacts (5), for socket 2Z1	34
Contacts (3), for sockets 2Z5-1, 2 and 3Z12	34
Core, (2) iron dust, for coils 1L11, 12	32
Core, iron dust, for coil 1L14	32
Core, iron dust, for coil 1L15	32
Microswitch, used on Z564 conversion kit	34
Module AE , F.M. Detector, complete	72
Plug, 4 pin, black 1Z2	34
Plug, 9 pin, white, 1Z3	34
Socket moulding, for 2Z1, less contacts	34
Socket moulding (3), for 2Z5-1, 2 and 3Z12, less contacts	34
Tuner, Z511 complete	73
Tuner, Z565 complete	73
